Heart Health and the Cardiac Eating Plan:
*Eat less cholesterol, fat, and sodium*

Eating large amounts of cholesterol, saturated fat, trans fat, and salt can raise your blood pressure and plug your arteries. This blocks the supply of red blood cells that carry oxygen to your heart and the rest of your body, and could lead to heart disease, heart failure, or death. Following these eating guidelines can help prevent these problems.

**Weight loss and weight control**

People who are overweight tend to have higher risk of heart disease and stroke. The cardiac eating plan can also help lower the number of calories you eat, which may help you lose weight.

**Blood cholesterol**

*Cholesterol* [koh-LESS-ter-awl] is a soft, waxy substance that carries digested fat from your liver to parts of your body. It helps build healthy cells that your body needs to work normally. Your liver makes all the cholesterol your body needs. This is called *blood cholesterol*.

*Dietary cholesterol* is in many of the foods you eat, including red meat, chicken, turkey, seafood, milk, and eggs. Eating foods that are high in dietary cholesterol, saturated fats, and trans fats also can raise your blood cholesterol.

When you have too much blood cholesterol, it builds up in your arteries. This buildup, called *atherosclerosis* [ath-er-oh-skleh-ROH-sis], makes it harder for blood to move easily through the arteries. Eating foods low in cholesterol and saturated and trans fats can help prevent this buildup in your arteries. Check food labels to see how much cholesterol, saturated and trans fats are in each item. Aim to eat 200 milligrams or less of cholesterol, 15 grams or less of saturated fat, and zero grams of trans fats per day.

<tbody>
<tr>
<td>A smooth, flexible artery carries blood easily from your heart to the rest of your body.</td>
<td>Cholesterol, fat, and other materials narrow the artery and limit blood flow. This puts you at risk of heart attack, stroke, or other health problems.</td>
</tr>
</tbody>
</table>
Lipids

Cholesterol and fat travel through your bloodstream in packages called lipoproteins [lip-poh-PRO-teenz]. When your health care provider checks your lipid levels, you’ll get information about low density lipoprotein, high density lipoprotein, and triglycerides [try-GLISS-ur-eye-dz]. Each of these types of lipoproteins affect your body differently.

- **Low density Lipoprotein (LDL),** often called bad cholesterol, is a dense type of cholesterol that tends to stick to the walls of arteries. High levels of LDL increase your risk of heart disease, so you want your levels to be as low as possible.

- **High Density Lipoprotein (HDL),** often called good cholesterol, carries LDL cholesterol from the arteries back to your liver. This prevents or slows the buildup of dangerous plaque. A high HDL level can lower your risk of heart disease. You want your HDL to be as high as possible.

- **Triglycerides** are the most common form of fat in your blood. Triglycerides store unused calories and give you energy. Too many triglycerides in your bloodstream can cause heart disease, which increases your risk for heart failure and stroke.

Fats

Your body needs some fat to run smoothly. But fat can also affect your cholesterol levels. Controlling how much fat you eat — as well as the types of fat you eat — can improve your cholesterol levels. Replacing cholesterol, saturated fat, and trans fats in your diet with polyunsaturated and monounsaturated fats will help lower your cholesterol and triglyceride levels, and risk of heart disease.

Types of fat

There are 4 types of fat — 2 healthy fats and 2 unhealthy fats.

- **Saturated fats** are an unhealthy type of fat. They are mostly found in foods that come from animals, such as meat, milk, butter, and cheese. They are also found in some tropical fruits and oils, such as coconut, palm, and palm kernel oils. An easy way to know if a fat is a saturated fat is to see if it stays solid even at room temperature. Eating foods high in saturated fats increases bad (LDL) cholesterol and triglycerides. Check all food labels and don’t eat more than 12 to 15 grams of saturated fat per day.

- **Unsaturated fats** are the healthiest type of fats. They remain liquid at room temperature. Eating foods high in unsaturated fats can help lower bad (LDL) cholesterol levels and your risk of heart disease. There are 2 basic types of unsaturated fat: monounsaturated and polyunsaturated.
Types of Fat (continued):

- **Monounsaturated fats** come mostly from plants. Examples include olive, canola, and peanut oils.
- **Polyunsaturated fats** also come mostly from plants but are also found in some fish like salmon and tuna. They can also help lower your blood cholesterol but should only account for 10% of your daily calories.
- **Omega-3 fatty acids** are a specific type of polyunsaturated fat that can help lower blood cholesterol and your risk of heart disease, as well as reduce inflammation. In high doses they may help lower your levels of triglycerides. Omega-3 fatty acids are found mostly in fatty fish, such as tuna, salmon, and trout as well as some plants, such as walnuts and flax seeds. Ask your doctor if you should take a supplement with Omega-3 fatty acids. Many food products have added Omega-3 fatty acids. Some examples include eggs, milk, chicken, and juice.

**To lower triglycerides**

Triglycerides are the most common form of fat in your blood. They store unused calories and provide you with energy. However, high levels of triglycerides can increase your risk of heart disease and stroke. The amount of triglycerides in your blood is mostly determined by the kinds of foods you eat, your lifestyle, and heredity. To lower triglycerides:

- Eat less saturated and trans fats and eat more polyunsaturated and monounsaturated fat instead.
- Choose whole grains, such as brown rice, whole wheat pasta, and whole wheat bread instead of white refined grains such as white rice, white pasta, and white bread.
- Avoid eating foods with added sugars, such as sodas, sugar-sweetened drinks, sweets, and desserts.
- Eat oily fish, such as salmon, trout, albacore tuna, sardines, or herring once or twice each week.
- Drink alcohol only in moderation. This means no more than 1 drink per day for women, and 2 drinks per day for men (see picture below).

**Do you have Diabetes?**

People with poorly controlled diabetes tend to have higher levels of triglycerides. If you have diabetes, you can lower your triglyceride levels by sticking to your diabetic diet more closely.

Your body uses triglycerides for energy, so eating fewer calories and exercising more will also help lower your triglyceride levels.

Have no more than 1 drink a day for a woman or 2 drinks a day for a man. **What is 1 drink? Each of these counts as 1 drink:**

- 5 ounces of wine
- 12 - ounce can or bottle of beer (light or regular)
- 1.5 ounces (one shot) of hard liquor (vodka, whiskey, gin, etc.)
- 4 ounces of sherry or liqueur
Sodium
Sodium (salt) helps your body balance fluid levels, but too much sodium can increase your blood pressure. High blood pressure can lead to heart disease or stroke, but the risk is greater in combination with high cholesterol. Less sodium means less fluid in your body, and a lighter workload for your heart. A low-sodium diet, along with lowering your cholesterol and triglycerides, will help lower your risk of heart disease and stroke. This means eating no more than 2300 milligrams (mg) of sodium per day if you have high blood pressure or 1500 mg per day if your blood pressure is not well-controlled or if you have heart failure.

Avoid adding salt to your food at the table, and don’t eat highly-salted foods or food preserved in salt (cured). Many convenience, fast food, and restaurant meals are very high in sodium. Strictly limit eating all fast foods and restaurant meals and choose low-sodium options when available. Skip the salt and try seasoning your food with spices, herbs, lemon, lime, or orange juices, and specialty vinegars instead.

General guidelines
- Limit red meats (beef, pork, and lamb) to 3 to 6-ounce portions, and only once a week. Substitute white meats like turkey or chicken, or meatless alternatives, such as soy, lentils, and legumes [lay-GOOMZ].
- Eat 4 ounces of fish at least twice each week. Fish, especially oily fish such as salmon and tuna, contain omega-3 fatty acids, which can lower the risk of heart disease.
- Eat shellfish and marine animals. They are low in fat and have little or no effect on the blood cholesterol. Don’t deep fry them and avoid eating them with butter or cream sauce.
- Eggs. If you have high cholesterol, diabetes, had a stroke or have heart disease, limit whole eggs to 2 to 3 per week.
- Limit the salt in your food. Avoid “lite” salt, which still contains salt. You can add a small amount of salt to your food while cooking but limit it to¼ teaspoon per pound of meat and up to ⅛ teaspoon per serving. Salt substitutes may be a good alternative but limit the amount you use because they can cause food to taste bitter. Check with your doctor before using salt substitutes because they contain potassium.
- To lower your salt intake, experiment with other herbs and spices to add flavor to your meals.
- Limit sweets, such as candy, desserts, bakery items, sugar sweeteners for coffee or tea, and sugar-sweetened beverages to 3 to 5 servings or less per week.
- Include generous portions of vegetables (raw, cooked, and salads).
- Choose fresh fruits, dried fruits with no added sugar, canned fruit packed in its own juice, and limit juice to 4 ounces (½ cup) of 100% fruit juice daily.
- Choose whole grain and high-fiber foods.
- Include nonfat or low-fat dairy products (milk, yogurt, and cheese).
- Include a variety of healthy, unsaturated fats such as those found in unsalted peanuts, nuts, and seeds, natural peanut butter or other nut butters, black olives, avocados, and liquid oils. Choose soft, tub margarines, low-fat mayonnaise, and light salad dressings.

</table>
Lowering fat, cholesterol, and salt in your diet

At the store:

- **Buy whipped or light tub margarine instead of hard stick margarine.** Soft margarine has less saturated fat than butter.
- **Don’t buy margarines with partially hydrogenated oil** listed as the first ingredient on the label, and avoid margarines containing trans fats, such as stick margarines.
- **Purchase lean meats.** Most red meat contains fat. A “prime” grade contains the most fat, “choice” grade has less, and “good” grade has the least amount of fat and cholesterol.
- **Try a salad herb mix instead of nonfat salad dressing,** which is usually high in salt. A flavorful alternative is vinegar with lemon or orange juice, fresh basil, oregano, parsley, chives, and a couple of cloves of garlic.
- **Purchase nonfat, fat-free skim milk** products whenever possible.

When eating out:

- **Ask to have your meal prepared without salt** when possible.
- **Consider ordering an appetizer instead of an entrée.** Portions are usually smaller and may be lower in unhealthy fat and calories.
- **Plan to eat ½ of your main dish and take the other ¼ home with you.**
- **Ask for your dressing on the side** so that you control the amount you eat.

When cooking:

The way you prepare foods can have a big impact on how healthy they are. Here are a few guidelines for heart-healthy cooking:

- **Broil meats on a rack rather than frying,** so the fat will drip off.
- **Steam, broil, bake or grill foods** whenever possible.
- **Trim all fat from meat before cooking.** This will prevent the meat from absorbing it. To enhance the flavor of low-fat cuts of meat, rub a salt-free seasoning blend on the meat. Spray a pan with oil and sear the meat on medium heat. Add a bit of water or salt-free broth to the pan until it just touches the meat. Cover the pan, turn the temperature down to low, and finish cooking.
- **When cooking with ground beef,** reduce fat further by using a ¼ pound or less of beef per person, and **drain the fat** after cooking. If you brown the ground beef before adding it to a sauce or casserole, you can rinse it in a colander with hot water.
- **If you must fry,** use **an air fryer**, or nonstick cooking spray and nonstick cookware instead of oil.

Remember: fat-free does not mean calorie-free!

Fat-free products can contain the same number of calories as the regular versions. If you are trying to lose or maintain your weight, be aware of the amount of calories you are eating and of the extra amounts of calories in foods labeled as “fat-free.”
• Use liquid oil instead of butter, margarine, or shortening.

• Sauté or stir-fry vegetables in chicken, vegetable, or beef stock that has had the fat removed. Or, use low-salt bouillon or water.

• Remove the skin from poultry before cooking. Much of the fat comes from the skin.

• Refrigerate a soup or stew so the fat will rise to the top and harden. You can easily scoop off the fat, then reheat the soup before serving. This also works on canned foods. Refrigerate the can before opening, remove the fat, then cook as normal.

• Add a few ice cubes to gravy. The fat will cling to the ice, making it easier to remove.

• Puree cooked vegetables and use the puree to thicken soups and stews instead of a roux [roo] (a mixture of butter or oil and flour).

• Make creamy soups using nonfat powdered milk. Mix with just enough liquids to dissolve the powder.

• Substitute light mayonnaise, low-fat or nonfat sour cream, or nonfat or plain yogurt for salad dressing in recipes.

Modifying recipes

With a little creativity and planning, most recipes can be made heart-healthy — often with little or no change in taste or texture. To lower the fat, cholesterol, and sodium in your favorite recipes, check the ingredient list, identify any ingredients you need to avoid or reduce, and apply one of these methods

1. ELIMINATION. If the ingredient isn’t essential — and it’s high in cholesterol, fat, or salt — don’t use it. For example, you can leave the salt out of many recipes and still have good results.

2. REDUCTION. If possible, use less of an ingredient. Many recipes will still turn out beautifully if you use less sugar, fat, or oil. Aim to reduce sugar in recipes by ¼ to ½.

3. SUBSTITUTION. Here’s your chance to be truly creative: what ingredient substitutions can you make to produce healthier dishes? The tables that follow offer a few tried-and-true food substitutions.

</table>
| 1 whole egg         | • 2 tablespoons egg whites  
                        | • ¼ cup egg substitute                                                                                                                     |
| 1 cup mayonnaise    | • 1 cup nonfat or low-fat yogurt  
                        | • ¾ cup plain low-fat yogurt mixed with ¼ cup or less low-calorie mayonnaise  
                        | • 1 cup low-calorie imitation, light, or fat-free mayonnaise                                                                         |
| 1 ounce cream cheese| • 1 ounce Neufchatel cheese  
                        | • 1 ounce lite or fat-free cream cheese  
                        | • 1 ounce fat free ricotta cheese                                                                                                     |
| 1 cup sour cream    | • 1 cup plain non-fat or low-fat yogurt  
                        | • 1 cup lower fat or non-fat sour cream  
                        | • 1 cup homemade mock sour cream: blend 1 cup low fat cottage cheese, 2 tablespoons buttermilk and ½ to 1 teaspoon fresh lemon juice in a blender until smooth |
| 1 ounce baking chocolate | • 3 tablespoons cocoa powder plus 1 tablespoon oil                                   |
| 1 pound ground beef | • 1 pound or less of extra lean ground beef (93% lean)  
                        | • 1 pound lean ground chicken or turkey breast  
                        | • 1 pound tofu  
                        | • 1 pound vegetables (for lasagna or pasta sauces, try zucchini or mushrooms)                                                       |
| 1 teaspoon salt     | • Allspice: stew, tomatoes, peaches, applesauce, gravies  
                        | • Basil: fish, lamb, salads, Italian sauces  
                        | • Cinnamon: fruits, pork, bread, sweet potatoes, squash, plain yogurt  
                        | • Cumin: chili, stews, beans  
                        | • Curry: lean meats, chicken, fish, tomatoes, sauces, rice  
                        | • Dill: fish, chicken, vegetables, potatoes, salads, pasta  
                        | • Garlic: lean meats, fish, poultry, soups, salads, vegetables, pasta dishes  
                        | • Lemon or lime juice: fish, poultry, salads, vegetables, sauces  
                        | • Nutmeg: potatoes, chicken, fish, cauliflower, broccoli, and cabbage dishes  
                        | • Onion: lean meats, stews, vegetables, salads, soups, legumes  
                        | • Oregano: sauces, Italian dishes, pizza, salads, vegetables  
                        | • Paprika: fish, poultry, soups, salads, meats, sauces, baked potatoes, beans,  
                        | • Rosemary: chicken, fish, lean pork sauces, stuffing, potatoes, peas, lima beans  
                        | • Sesame seeds: salads, breads, chicken, vegetables, casseroles  
                        | • Tarragon: sauces, salad dressings, marinades, vegetables, beets, chicken, fish  
                        | • Thyme: lean meats, poultry, sauces, soups, peas, salads, tomatoes                                                             |
