

# Coronary Heart Disease Preventive Care Recommendations

Recommendation		Treatments and Targets					
<b>1. Lifestyle Management</b> <ul style="list-style-type: none"> <li>TEACH patients to follow a healthy lifestyle</li> </ul>		<ul style="list-style-type: none"> <li><b>Physical activity:</b> &gt;30 minutes/day, moderate intensity, 5-7 days/week</li> <li><b>Diet:</b> limit saturated fat, trans-fat, and sugar; eat more fruits, vegetables, low-fat proteins, high-fiber foods</li> <li><b>Weight management:</b> BMI 18.5-24.9; waist circumference &lt;40" (men), &lt;35" (women)</li> <li><b>Smoking:</b> Don't smoke; avoid second-hand smoke/pollutants</li> </ul>					
<b>2. Lipid Management</b> <ul style="list-style-type: none"> <li>MEASURE fasting lipid profile every 5 years beginning at age 20 years.</li> <li>Repeat annually if results are abnormal, patient is on lipid-lowering therapy, or patient has known CHD</li> <li>Treat based on LDL value and risk category</li> </ul>		Risk Category		Drug Therapy	LDL-Goal		
		<b>High Risk</b>	<ul style="list-style-type: none"> <li><b>CHD (coronary heart disease)</b> <ul style="list-style-type: none"> <li>History of myocardial infarction</li> <li>Acute coronary syndrome</li> <li>Angina or equivalent</li> <li>Coronary artery procedures</li> <li>Evidence of myocardial ischemia</li> </ul> </li> <li><b>CHD risk equivalents (atherosclerotic disease)</b> <ul style="list-style-type: none"> <li>Peripheral arterial disease</li> <li>Abdominal aortic aneurysm</li> <li>Carotid artery disease</li> <li>Diabetes Mellitus</li> </ul> </li> </ul>	<b>Initiate statin for ALL high risk patients</b>	<b>LDL &lt;70 mg/dL</b>		
			<ul style="list-style-type: none"> <li><b>≥2 of the following risk factors:</b> <ul style="list-style-type: none"> <li>Age (men ≥45 years; women ≥55 years)</li> <li>Cigarette smoking</li> <li>Hypertension (BP ≥140/90 mmHg or on antihypertensive medication)</li> <li>Low HDL cholesterol (&lt;40 mg/dL)</li> <li>Impaired fasting glucose (101-125 mg/dL)</li> <li>Family history of premature CHD (CHD in male first-degree relative &lt;55 years or female first-degree relative &lt;65 years)</li> <li>Evidence of subclinical vascular disease (e.g., coronary calcification)</li> <li>Elevated hsCRP (≥2.0 mg/L)</li> </ul> </li> </ul>			Initiate <b>statin</b> if lifestyle management does not achieve LDL <130 mg/dL	<b>LDL &lt;100 mg/dL</b>
			<ul style="list-style-type: none"> <li><b>0-1 risk factor</b> (see above)</li> </ul>			Initiate <b>statin</b> if lifestyle management does not achieve LDL <160 mg/dL	<b>LDL &lt;130 mg/dL (&lt;100 ideal)</b>
Recommendation		Treatments and Targets					
<b>3. Glucose Management</b> <ul style="list-style-type: none"> <li>MEASURE fasting glucose every 3 years beginning at age 45 (more often or beginning at a younger age if clinically indicated)</li> </ul>		<ul style="list-style-type: none"> <li>Fasting blood glucose: <b>&lt;100 mg/dL</b></li> <li>Post-prandial glucose: <b>&lt;140 mg/dL</b></li> </ul>					
<b>4. Blood Pressure Management</b> <ul style="list-style-type: none"> <li>MONITOR blood pressure every other year (more often if clinically indicated)</li> </ul>		<ul style="list-style-type: none"> <li>Optimal: <b>&lt;120/80</b></li> <li>Minimal: <b>&lt;140/90</b></li> <li>If diabetes or renal disease: <b>&lt;130/80</b></li> </ul>					

Recommendation		Treatments, Tests, and Targets		
<b>5. Management of other risk factors</b>	<b>Factor</b>	<b>Treatment, Test, or Target</b>		
	• >1 CHD risk factor	<b>Aspirin 81 mg daily</b>		
	• Metabolic syndrome or obesity (especially central adiposity)	Physical activity and diet as recommended under Lifestyle Management on page 1. Refer patient to Intermountain's <i>Weigh to Health™ Nutrition Program</i> .		
	• High triglycerides	<b>Target &lt;150 mg/dL</b> through healthy lifestyle changes, medical therapy with fenofibrate or niacin if clinically indicated		
	• Low HDL	Physical activity, diet, and consider <b>niacin</b> .		
• Inflammatory markers	Consider measuring <b>hsCRP</b> (>2 mg/L increases risk) and <b>LpPLA2</b> (>250 mg/dL increases risk) in borderline cases			
<b>6. Coronary Artery Calcification (CAC) screening for asymptomatic patients* with MCCT (multislice cardiac CT).</b> Consider screening for men 45-75 years and women 55-75 years with: <ul style="list-style-type: none"> <li>Moderate or high risk of CHD (see page 1)</li> <li>When a positive or negative scan would influence therapeutic decision-making or patient adherence</li> <li>Low likelihood of significant, obstructive CAD</li> </ul> <i>*CAC is predictive of differential risk in asymptomatic diabetes</i>	<b>Risk category based on CAC result</b>		<b>Tests and treatments</b>	<b>Target</b>
	<b>Very High Risk</b>	CAC>400 or >90 <sup>th</sup> %tile for age	Proceed to cardiac CT angiogram or imaging stress test	<b>LDL &lt;70 mg/dL</b>
	<b>High Risk</b>	CAC 100-399 or 75 <sup>th</sup> - 89 <sup>th</sup> %tile for age	Aggressive medical management Consider imaging stress test	<b>LDL &lt;70 mg/dL</b>
	<b>Moderate Risk</b>	CAC >1 but <100 and <75 <sup>th</sup> %tile for age	Medical management	<b>LDL &lt;100 mg/dL</b>
